

**Dear Fellow Customer:**

**Thank you again for purchasing the Duo Coffee Steeper.**

**Please read the following additional safety instructions concerning the operation of your Duo Coffee Steeper on how to properly attach the glass carafe to the stainless steel top chamber.**

Please take special care when screwing the bottom glass carafe into the stainless steel top chamber to avoid glass breakage. Make sure that the glass and metal portions are level before you screw them together to avoid cross-threading. Only when level, slowly turn the metal portion with gentle pressure until the metal and the glass units lock. Do not keep turning or twisting beyond this point, for this may cause glass on the glass unit to crack or break. If the two parts don't screw together with gentle pressure, stop, rotate in the opposite direction until the two units are detached, and try again.

If you hear any cracking while screwing the two units together, stop use immediately and check the glass carafe to ensure no breakage or chipping has occurred. If it has, discard the glass carafe promptly.

Do not twist top brewing chamber quickly to release hot beverage. Slowly twist top brewing chamber to release beverage safely. If top brewing chamber is twisted quickly, beverage may burp out of Duo's spout.

**Thank you,  
Fellow**
